

## PAYLOAD ANALYSIS@EATON

QXtend

1/16/2017

Regoti, Sujata  
@Eaton  
QXtend

1. From payload get end point

```
<qcom:propertyName>EndpointURK</qcom:propertyName>  
  
<qcom:propertyValue>  
http://heuqa.tcc.etn.com:8081/heu1qxi163/services/QdocWebService  
</qcom:propertyValue>
```

In the above endpoint URI, nhaqxi163 represents nha QXtend Inbound. For outbound : nhaqxo163

Use Link : <http://heuqa.tcc.etn.com:8081/heu1qxi163>

2. Get wsaTo Property

```
<ns2:propertyName>wsaTo</ns2:propertyName>  
<ns2:propertyValue>urn:services-qad-com:QXIheu1mfg  
</ns2:propertyValue>
```

Here outbound receiver QXIheu1mfg.

3. Open above URI. Go to Configuration->Receivers->Outbound

Outbound Receivers			
	Name	Description	Require Authentication
<input type="checkbox"/>	heuqueryqxi	HEU CRP query receiver	false
<input type="checkbox"/>	qxi_query	query service	false

Under receivers find above receiver name.

Here QXIheu1mfg doesn't exist. So we get warning.

4. In given payload , we can find

```
<ns1:result>warning</ns1:result>
```

And exact warning as

```
<ns2:tt_msg_datetime>2017-01-13T07:46:13+0000</ns2:tt_msg_datetime>
```

```
<ns2:tt_msg_desc>WARNING: Location Master does not  
exist.</ns2:tt_msg_desc>
```
